Bistec Industry Readiness Construction Project – BRD

Business Requirements Document

Construction Material Price List, BSR & Project Payment Management System

Field	Details
Client	Vega Construction
Document Purpose	Capture and document requirements gathered from the client meeting, for handover to the development team for prototype build
Prepared By	Oneth
Date	09 July 2026
Status	Draft

1. Executive Summary

The client operates in the building construction industry and manages two core business stages: a pre-contract stage (site visits, estimation, and preparation of the Building Schedule of Rates) and a post-contract stage (construction execution and payment collection across five construction stages). Currently, material prices, rates, and financial tracking are managed manually through multiple Excel sheets, leading to inaccurate values, lack of visibility into when prices were last updated, and difficulty tracking income, expenses, and outstanding payments. The client has requested a system to digitize and centralize price list management, BSR generation, and post-contract payment and ROI tracking.

2. Business Background & Current Process

2.1 Pre-Contract Stage

During the pre-contract stage, the client visits the planned construction site to provide the customer with a cost estimate. This estimate is built using the current price list and rates for materials, labor, and suppliers. Based on the estimate, the client prepares a Building Schedule of Rates (BSR) document, currently maintained in Excel.

2.2 Post-Contract Stage

Once a contract is signed, the project moves through 5 construction stages. Each stage has 3 payment milestones collected from the customer:

- Advance payment — 50%
- Interim payment — 25%
- Final payment — 25%

The client currently tracks income, expenses, credit/outstanding payments, and cheque payments across several separate Excel sheets, and manually calculates ROI based on this data.

3. Problem Statement

- Price list and rates for materials, labor, and suppliers are managed manually in Excel, leading to data entry inaccuracies.
- There is no reliable way to see when a price or rate was last updated, or whether the current price list is outdated.
- BSR documents are manually built in Excel, with no direct link to the master price list — increasing the risk of using outdated rates.
- Post-contract financial tracking (income, expenses, outstanding payments, cheque payments) is spread across multiple Excel sheets, making ROI calculation slow and error-prone.

4. Proposed Solution Overview

A system with three core modules is proposed:

- Material Price List & Rate Management — a central place to add and update material, labor, and supplier rates, with automatic update timestamps.
- BSR Module — a digital recreation of the existing Excel BSR format, which pulls live rates from the price list module when materials are added to a project estimate.
- Post-Contract Payment & ROI Dashboard — a dashboard to track payments received, payments made, outstanding payments, and cheque payments across the 5 construction stages and 3 payment milestones, with overall expense and ROI calculations.

5. Functional Requirements

5.1 Module 1 — Material Price List & Rate Management

ID	Requirement	Description
FR-1.1	Add/Update Materials & Rates	The system shall allow the client to input new materials, labor items, and supplier rates, and update existing ones.
FR-1.2	Auto Timestamp on Update	The system shall automatically capture and display the date and time whenever a price or rate is added or updated.
FR-1.3	Categorization	The system shall allow rates to be grouped by category (e.g. materials, labor, suppliers).
FR-1.4	Search & Filter	The system shall allow the client to search and filter the price list by item name or category.
FR-1.5	Single Source of Truth	Rates maintained in this module shall be the source used to populate the BSR module (see Module 2).

5.2 Module 2 — Building Schedule of Rates (BSR)

ID	Requirement	Description
FR-2.1	Recreate BSR Format	The system shall recreate the client's existing Excel BSR layout/format digitally.
FR-2.2	Create Project BSR	The client shall be able to create a new BSR for each construction project/site estimate.

FR-2.3	Add Materials to BSR	The client shall be able to add required materials (and labour/supplier items) to a project's BSR.
FR-2.4	Auto-Fetch Rate	When a material is added to the BSR, the system shall automatically fetch and display its current price/rate from the Price List module (Module 1).
FR-2.5	Estimate Calculation	The system shall calculate line-item and total estimate values based on quantities entered against fetched rates.

5.3 Module 3 — Post-Contract Payment & ROI Dashboard

ID	Requirement	Description
FR-3.1	Track Construction Stages	The system shall track project progress across the 5 defined construction stages.
FR-3.2	Track Payment Milestones	The system shall track the 3 payment milestones per stage: Advance (50%), Interim (25%), and Final (25%).
FR-3.3	Manual Payment Status Update	The client shall be able to manually mark each payment as Paid, Not Received, or Paid via Cheque.
FR-3.4	Payments Dashboard	The system shall provide a dashboard showing payments received, payments made (expenses), outstanding payments, and cheque payments.
FR-3.5	Overall Expense Calculation	The system shall calculate and display total project expenses.
FR-3.6	ROI Calculation	The system shall calculate and display overall ROI based on income received versus expenses incurred.
FR-3.7	Match Existing Format	The dashboard layout shall follow the structure/format of the client's existing Excel tracking sheets, for familiarity.

6. Assumptions

- The system will be used primarily by the client (single primary user) unless additional staff/user roles are confirmed.
- The 3 payment milestones (50% / 25% / 25%) apply once per construction stage, i.e. across all 5 stages, pending client confirmation (see Open Questions).
- A web-based application is assumed for the prototype unless the client specifies a desktop or mobile platform.
- The system will initially support a single currency.
- Historical price changes are assumed to only require a "last updated" timestamp at this stage, not a full version history — to be confirmed.
